## INTRODUCTION

- $\succ$  Involvement of the general public (i.e. non-scientists) in the research design, data collection, interpretation and various scientific tasks with collaboration from professional scientists is generally referred to as citizen science (CS) (Buytaert *et al.* 2014).
- > In the social and political development context, public participation has been

### **RESULTS AND DISCUSSIONS**

embedded into the mainstream for decades. CS emerged from and across many disciplines, is not a new concept but is becoming increasingly popular even in scientific research (Silvertown, 2009).

- $\succ$  Hydrology remains a highly data-scarce; in many regions, if data exists, the lengths of the time series are not sufficient. The increased availability of Information and Communication Technology (ICT) - in particular, mobile phone opens up new ways of data acquisition and dissemination.
- > Smartphones for water (S4W)-Nepal has started CS utilizing mobile technology for hydrological data measurement (precipitation, streamflow, groundwater level/quality, stone spout flow/quality, land use, ecological stream health assessment). This paper has attempted to analyse S4W-Nepal CS based precipitation data of Kathmandu valley for the year 2017.

#### **OBJECTIVES**

- $\succ$  The purpose of this study is to assess the performance of CS based precipitation data.
- > This study compares with the precipitation data maintained by the Department of Hydrology and Meteorology (DHM).

Spatial distribution of 1-day precipitation in Kathmandu Valley. [N = number of CS precipitation stations recorded on that day]

### **DATA AND METHODS**

 $\succ$  83 stations placed at different locations of the valley are used. The average no. of days with recorded precipitation is 49.

Acknowledgements: The authors are thankful to the DHM and S4W-Nepal for providing us the precipitation data.

negatively deviated most of the time

#### **CONCLUSIONS AND RECOMMENDATIONS**

- > The availability of CS data is very poor except few stations. There are huge data gaps in time series data. The station wise data comparison is quite challenging.
- $\succ$  In any case, huge spatial gaps for local variability are fulfilled by these data. The performance of spatially interpolated data is in good agreement. The spatially averaged CS precipitation shows a slightly positive deviation compared to spatially averaged DHM precipitation in Kathmandu Valley. The stations wise comparisons have mixed deviations.

#### > Comparison with satellite based products will be our future works.
